

Cell develops, early formation of unity

Unity continues to form

Identity of sameness B differences are insensitible

Ke contradictory motion—internal, self-motion, auto-dynamic

Identity of essential differences

Development of opposites: One aspect of the unity (one of the opposites) assumes a dominant, leading position and role

Identity of opposites in unity: Both simultaneously possess minor unity and concrete identity; each contains the opposite within itself; one is the decisive leading aspect

Identity of the principal contradiction (where there are multiple contradictions (the unity above represents a single contradiction))

Opposites simultaneously interpenetrate, post. B negates one another: this interaction is the basis of motion

Unity B struggle of contradictory aspects of a unity: Opposites simultaneously in unity and engaged in complementary struggle (Mutual exclusion B mutual negation)

Growth of each aspect of the primary contradiction until it reaches the limits of the other growing aspect

Interpenetration of opposites: The contact necessarily produces two and then each opposite new 'things' in each: reactionary B embryonic counterpoint revolutionary extremes

Opposites continue to mutually penetrate one another: each opposite exchanges with its embryonic counterpart

Growth of interpenetrated opposites within same unity: embryonic formation of new entity (the reactionary old will remain larger than the revolutionary new [until it gains strength in regression])

Opposites continue interpenetrating—the leading one (white) maintains its hierarchical position above its opposite (black); both grow as they struggle for motions

Measure: Quantitative limits within the unity is reached: temporary paralysis of opposites (no apparent movement)

As opposites continue interpenetrating and exchanging with their embryonic counterparts, tension naturally and necessarily builds

Antagonism develops between contradictory aspects: the embryonic extremes grow in response to the increased tensions

Intensification of antagonism in contradiction

Inversion: extreme of one state suddenly passes into its opposite—the white becomes the black and the black becomes the white

Inverted opposites continue moving until the model line—the shield of qualitative limit—is reached: white becomes both white and black B black becomes both black and white

In complete balance, the opposites are in a momentary state of paralysis: unable to move

RBL 1: Reactionary old fights fiercely for its life: as a result, the unity begins regressing into earlier forms of existence: revolutionary new does fight for its life but is not as strong

RBL 2: Reactionary aspect temporarily wins B dominates: the new fights for itself, undermining the old's position: the strength of the old's position—its embeddedness—determines how intense the fight will be, how far the unity will regress, and how long the regression will last: the more rooted B powerful, the harder the fight, the more forces will be garnered to win

RBL 3: The reactionary aspect forges a regression so intense that its existence can no longer be maintained (it can no longer live); the revolutionary new grows stronger as the reactionary old decays

RBL 4: Revolutionary new is forged anew, strengthened by such intense decay: it stands sharply contrasted against the rotten old and becomes a formidable enemy: the reactionary aspect wages an intense struggle for its life in the face of death

Accelerated metabolism: movement toward evolutionary leap

Rupture, break in continuity

Leap: revolutionary victory

Motion toward resolution on a higher level: revolutionary new securing control

Revolutionary Suppression: destruction of old, negation of revolutionary new, B consolidation of revolutionary new

Progressive Sublation: Negation of old and preservation of the best lessons B aspects

Revolutionary affirmation

Nascent (new) unit

Process of reformulation

Accelerated metabolism: movement toward evolutionary leap

Rupture, break in continuity

Leap: revolutionary victory

Motion toward resolution on a lower level: Moribund old securing control

Devolutionary Suppression: Destruction of the progressive new, negation of the devolutionary new B consolidation of devolutionary new

Regressive Sublation: Negation of new and preservation of the worst lessons B obsolete aspects

Devolutionary affirmation

Moribund old

Process of deformation
